

Rodion Myshalov

SENIOR BACKEND ENGINEER

Bangkok, Thailand

rodionmyshalov@gmail.com | +66 98 245 8188 | [linkedin.com/in/myshalove](https://www.linkedin.com/in/myshalove) | github.com/myshalove

PROFESSIONAL SUMMARY

Backend engineer with X years of experience in domain. Built system and achieved verified result or scale. Strong in technology, technology, and practice.

TECHNICAL SKILLS

Languages	Go, SQL
APIs	REST + OpenAPI/Swagger, gRPC + Protobuf, OAuth + JWT, GraphQL, Webhooks
Databases	PostgreSQL, MySQL, MongoDB, Redis
Message Brokers	Apache Kafka, RabbitMQ
Infrastructure	Docker, Kubernetes (K8s), Helm, Nginx / Angie, HashiCorp Vault
CI/CD	GitLab CI, GitHub Actions
Monitoring	Prometheus, Grafana, Sentry, ELK (Kibana)
Architecture	Monolith, Microservices
Design	TDD, DDD, Clean Architecture
Testing	Unit, Integration, Race detection

WORK EXPERIENCE

SOHO.LMS

Senior Go Engineer

Online education platform

Sep 2023 – Present
Valencia, Spain (Remote)

- Develop the Go scheduling and live-lesson service: recurring classes, teacher availability, rescheduling and video lesson launch. Cut calendar p95 load time from 1.2 s to 120 ms (–90%); the service handles up to 3,000 RPS when classes start.
- Built the payment flow on Stripe and acquiring webhooks: automatic course access after payment, subscriptions and debt tracking. Access is granted in 10 seconds instead of 2–4 hours of manual checks; paid orders without access dropped from 2.5% to 0.1%.
- Developed a Kafka-based notification service with retries and deduplication across Telegram, WhatsApp, SMS, email and mobile push. Delivers up to 2M messages a day, cut undelivered messages from 6% to 0.5%, and reminders raised lesson attendance by 15%.

Taptima

Middle+ Go Developer

Outsourced development: web services, mobile apps and e-commerce.

Dec 2020 – Sep 2023
Limassol, Cyprus (On-site and Remote)

- Migrated a cinema chain's monolithic backend to microservices and built a Go background sync service that pulls 500+ films and 12,000+ showtimes separately from an external system, links them and caches them in PostgreSQL. Showtime listing p95 fell from 900 to 70 ms (–92%), the service handles up to 4,000 RPS on premiere days, and chat alerts cut sync-failure detection time from several hours to 2 minutes.
- Redesigned ticket payments from synchronous REST to asynchronous processing via a task queue and bank webhooks for successful and failed payments: checkout p95 dropped from 3.5 s to 220 ms (–94%), charges without an issued ticket fell from 1.8% to 0.1%, and payment support tickets fell by 70%; up to 1,200 orders per minute at peak.
- Extracted authentication into a standalone service that issues JWTs independently of the rest of the backend: one-time codes via SMS and email, OAuth 2.0 via Google, Facebook and Telegram. Handles up to 2,000 login RPS at ticket-sale openings with 90 ms p99, reduced main backend load by 35%, and cut peak login errors from 4% to 0.2%.

DNS

Junior Go Developer

Online consumer electronics retailer.

Oct 2019 – Dec 2020
Vladivostok, Russia (On-site)

- Built a Go order assembly service (gRPC, PostgreSQL, Kafka) for the PC configurator: it aggregates components,

generates the invoice and hands the order to checkout; handles up to 1,200 RPS at sale peaks with 180 ms p99.

- Cut invoice generation p95 from 420 to 150 ms (–64%) by replacing sequential calls to pricing, stock and compatibility services with parallel errgroup calls backed by a Redis cache.
- Reduced lost and duplicated orders on handoff to checkout from 0.8% to 0.05% by introducing a transactional outbox, idempotency keys and retries with backoff.

SIDE PROJECTS

ReadBeat

Jun 2026 – Present

CTO

Remote

Media portal for the beatbox community: event listings for battles, festivals and jams.

- Architected the Go backend: GraphQL API (gqlgen), REST image uploads documented with OpenAPI, PostgreSQL (pgx, golang-migrate) and Redis-backed admin sessions.
- Enforced Clean Architecture layering with arch-go and golangci-lint (gosec, revive) as CI gates.
- Built the GitHub Actions pipeline: codegen drift check, race-detector integration tests against PostgreSQL and Redis, SSH deploy of distroless Docker images behind Nginx.

Big Dope Label

Mar 2026 – Present

CTO

Remote

First beatbox label in Russia — bigdope.pro.

- Set up production hosting: Dockerized Nginx with Let's Encrypt TLS and automated certificate renewal.
- Built traffic analytics and log management as separate containers: GoAccess, logrotate and a password-protected log viewer.
- Automated CI/CD on GitHub Actions: lint and tests on every push, SSH deploy with Docker Compose.

EDUCATION

Bachelor's degree, Mathematics and Computer Science

2022

Far Eastern Federal University

Vladivostok, Russia

LANGUAGES

English (B2) | Russian (Native)
