Rodion Myshalov

SENIOR BACKEND ENGINEER

Bangkok, Thailand

rodionmyshalov@gmail.com | +66 98 245 8188 | linkedin.com/in/myshalove | github.com/myshalove

SUMMARY

Senior Backend Engineer with **7+ years** of software engineering experience focused on backend systems, Go, databases, asynchronous processing, APIs and distributed systems. Designed systems from scratch, made architectural decisions, owned production services, and defined engineering standards.

SKILLS

Languages	Go, PHP (Symfony), SQL
APIs	REST/OpenAPI, gRPC/Protobuf, GraphQL, OAuth/JWT, Webhooks
Databases	PostgreSQL, MySQL, Redis
Message Brokers	Apache Kafka, RabbitMQ
Infrastructure	AWS, Docker, Kubernetes, Helm, HashiCorp Vault, Nginx / Angie
CI/CD	GitLab CI, GitHub Actions
Observability	Prometheus, Grafana, OpenTelemetry, Sentry, ELK (Kibana)
Architecture	Clean Architecture, DDD, TDD
AI Workflows	Claude Code, Cursor, Codex

EXPERIENCE

International B2C online platform — Sep 2023 – Present

Senior Go Engineer — Remote

Confidential (NDA).

- Authored and launched to production a standalone Go service extracted from the legacy monolith. Backed by a Redis cache, the service handles about 5,000 RPS from the frontend via REST and about 15,000 RPS from external services via gRPC. Migrated about 430,000 interlinked records (about 99% automatically) and reached 40% test coverage across the service with CI integration.
- Built 5 shared Go packages (common data import, external-service authorization via OAuth/JWT, client contract builds, service bootstrap, user-action confirmation) used across 5 services, cutting typical cross-service tasks from several days to a couple of hours.
- Reviewed code, mentored developers from other projects, and promptly fixed critical production bugs.
- Designed a confirmation flow for write actions by a restricted group of users. Each action is confirmed with a code or approved by the responsible team via webhook, with no extra steps when approval is not required.
- Integrated Postman test execution into the CI pipeline, simplifying QA work. Wrote a response-schema parser for client contracts that handles nested schema trees.
- Contributed to the Kubernetes rollout (Helm, HashiCorp Vault, Prometheus, OpenTelemetry) and test environments that switch integrations between mocks and real services via GitLab CI/CD.

SOHO.LMS — Aug 2022 – Sep 2023

Middle Go Developer — Remote

Online education platform.

- Built a Kafka-based execution pipeline for workflow trees. Admins define the action catalog (email or SMS after payment, course enrollment, demo access until a deadline, enrollment on the deadline date), and schools assemble trees in their account. Automated work previously done by staff, cutting setup of one flow from hours to minutes.
- Reduced API response time of the mobile app's student service by 30% by replacing heavy REST calls with GraphQL fragments, which fetch only the fields each screen needs, and adding PostgreSQL indexes (e.g., GIN for JSONB-based filtering).
- Developed a gamification system with achievements and points that users can spend instead of money.

Taptima Sep 2019 – Aug 2022
Back End Developer Remote
Outsourcing studio building systems for entertainment and media clients.

- Architected a RabbitMQ-based pipeline for the Gorky Theater website, which sold its own tickets and aggregated citywide event listings. Imported about 1,000 new, repeated and updated event records a day, with about 20,000 available seats, from an external ticketing system into MySQL and served the schedule via GraphQL instead of live external calls. Cut schedule API response time by 70% and sustained 10,000 RPS at the summer peak, including traffic from third-party aggregators scraping the site.
- Led a cross-functional team of 4 (2 backend, 2 frontend) building self-service ticket kiosks for Illuzion Cinema. Integrated bank payment terminals and ticket printers with failure handling and payment reconciliation. Kiosks handled about 40% of on-site sales, reducing cashier workload.
- Set up Sentry and Grafana monitoring across 4 kiosks to detect errors and freezes remotely, without server log digging or CCTV checks.
- Migrated a legacy WordPress portal to Symfony 6 for HTReviews, redesigning a single-table database into a normalized schema. Transferred 10,000+ records and cleaned up about 2% duplicated or corrupted entries.
- Contributed to containerizing services with Docker, cutting deployment time from about 7 min to under 1 min.

SIDE PROJECTS

ReadBeat Jun 2026 – Present
Tech Lead Remote
In development. Media portal for the beatbox community with event listings and news.

- Architected the Go backend from scratch on Clean Architecture, with layer dependency rules enforced in CI by arch-go. The stack includes a GraphQL API (gqlgen), REST image uploads documented with OpenAPI, PostgreSQL (pgx), and a Redis read cache for events and news, reset per section on any admin change.
- Set up CI/CD on GitHub Actions with a generated-code drift check, golangci-lint, arch-go and Go tests under the race detector, including integration tests against real PostgreSQL and Redis. Deployed distroless Docker images behind Nginx over SSH.
- Defined the engineering process for the monorepo (Go backend, React/TypeScript frontend, admin panel), including pull requests with code review, commit conventions and documentation on architecture, APIs and features.

EDUCATION

Bachelor's degree, Mathematics and Computer Science 2018 – 2022
Far Eastern Federal University Vladivostok

LANGUAGES

English (B2) | Russian (Native)
